**Quick release
couplings**

Introduction

HYDAC couplings have proved their worth over many years of practical use in hydraulics. The high quality of the couplings is the result of constantly improving the products, while also taking account of users' experience. Their high manufacturing standard, combined with quality management to EN ISO 9001, guarantees the quality of our products.

The following characteristics apply to the couplings in our catalogue.

Housing material:

Steel corresponding to EN 10277, zinc-plated

Seals:

NBR/PTFE

Operating temperature:

- 30 °C to + 100 °C

Other applicable standards:

EN ISO 8330:2000, ISO 5675, ISO 5676, ISO 7241, ISO/DIS 16028

Please enquire about other material combinations.

Our range includes:

- Push fit couplings to ISO 7241-1, series A
- Push fit couplings, flat face, to ISO/DIS 16028
- Push fit couplings in plastic
- Locking couplings for hydraulic braking systems to ISO 5676
- Screw couplings
- Screw couplings for high pressures
- Pipe couplings

We are showing you a selection of these in this catalogue.

The operating pressures given in our catalogue relate to the strength of the housing components. Standardised connector shapes can have other nominal pressures, which do not have to apply to the type of coupling concerned.

Special agreements are possible.

It is not possible to make a general statement about the compatibility of our couplings to bio-oils. It can however be presumed that the compatibility will be the same as for rubber hoses.

A test will be required to make a definite statement in each case. Apart from the standard couplings, custom versions can also be supplied.

If you have a particular problem to solve, please get in touch with us.

As part of our process of continuous improvement, we reserve the right to make technical changes.

Description

HYDAC offers a wide range of products for agricultural machinery as well as for hydraulic systems in vehicles and construction machines. Thanks to their modular design, a large variety of connections is available, which conform to international standards.

Technical Data

Dimensions	According to ISO 7241-1, series A, as well as ISO 5675		
Housing material	Steel corresponding to EN 10277		
Material of seals	NBR / PTFE ISO 3601		
Operating pressure	P_{max}	250 bar	With standard threaded connections, the operating pressure is governed by the highest rated pressure of the connection.
Burst pressure	$P_{coupled}$ P_{female} P_{male}	1000 bar 1000 bar 1000 bar (except size 25 → here max. 700 bar)	
Ports	Male thread DIN 3852 Female thread DIN 3852 Male stud with type W bore (24°) to DIN 3861 Male stud with type W bore (24°) to DIN 3861, bulkhead		
Operating temperature	-30°C to +100°C		

NOTE

The information in this brochure relates to the operating conditions and applications described.

For applications and operating conditions not described, please contact the relevant technical department.

Subject to technical modifications.

Accessories

Dust protection parts

These dust caps and dust plugs can be retrofitted to the connectors.

Description

During coupling and releasing, the design of the flat face push fit couplings ensures minimal oil loss and minimal air incursion. Due to the fixed valve tappet in the coupling, backflow is effectively prevented.

The couplings are also designed for easy cleaning and to keep dirt out.

Their main applications are for machines which work in environmentally sensitive areas and hydraulic tools. Thanks to their modular design, HYDAC can make a large variety of connections available which conform to international standards.

Technical Data

Dimensions	to ISO/DIS 16028							
Housing material	Steel corresponding to EN 10277

V = Oil velocity

Safety precautions for the handling of quick release couplings and the corresponding accessories

Important !

Incorrect selection or incorrect and inexperienced handling of couplings and accessories can lead to material damage and personal injury.

- Escape of hydraulic fluids under high pressure
- Explosion or ignition of the fluid used
- Collision with parts starting to move or fall, caused by the failure of the hydraulic circuit
- Dangerous lashing of the hydraulic hoses (so-called whipping effect)
- Risk of injury due to contact with hot or cold fluids or fluids which are dangerous for other reasons

Before you select and use a quick release coupling or the corresponding accessories, it is vital that you comply with the following instructions.

1. General information

1.1 General

This section contains instructions on the choice and handling (installation, coupling and disconnecting procedure and maintenance). This is to be understood as additional safety information and must be considered when using the products.

1.2 Safety precautions

Under certain circumstances, couplings can unexpectedly fail. Take account of this when planning your system or plant, using safety devices.

1.3 Information for the user

Pass these safety instructions on to the persons who are responsible for the selection or handling. Only use the couplings after you have received and understood the product-specific information.

1.4 The user's responsibility

Owing to the large variety of applications for quick release couplings, it is not possible to consider every application and each technical detail.

The user is responsible for

- The final selection of the product
- The operator's compliance with the requirements
- The safety of persons and plant
- The safety precautions which are necessary when using couplings

Should you have any other questions, please contact our sales team.

2. Notes for the correct choice of coupling

2.1 Pressure range

The couplings must be chosen so that their maximum permissible operating pressure is greater than or equal to the system pressure. Pressure peaks in the system, which exceed the operating pressure will reduce the coupling's service life and must thus be considered when making the selection.

2.2 Media resistance

The sealing materials in the locking couplings are suitable for numerous pressurised media.

Your product manager will supply you with information about compatibility with a fluid on request.

2.3 Working temperature

The working temperatures in the specifications are maximum values. These values must not be exceeded with a stationary or a circulating circuit. During actuation, the natural heating of the coupling must be considered.

2.4 Size

The choice of size and type of connection depends upon the required level of power transmission. The corresponding diagrams are to be used for this.

Flow rates, pressure drops and flow speeds must be considered when choosing the correct size.

If these values are exceeded during operation, faults may occur in the function of the coupling.

2.5 Mechanical connection

The connection of two halves of a coupling depends on the model. Here care should be taken that push-fit couplings completely engage and that screw-fit couplings are fully screwed on, until the stop is reached.

Forcefully and improperly undoing locking couplings will lead to faults.

2.6 Thermal loading

Strongly heating above the recommended operating temperature, by welding or soldering on the couplings, can produce hazardous gases. Apart from that, the surface protection (zinc plating) can be damaged. This can interfere with proper functioning.

2.7 Guidelines

All of the specifications and standards applicable for the area of application must be complied with when making a choice.
